

- 4 straight wide grooves enhance tire drainage efficiency and maneuverability on wet road condition.
- The sub straight grooves on tire shoulder reduces shoulder stiffness and prevent from irregular wear.
- Sipes on tire shoulder and center can reduce stiffness, noise. And enhance driving comfort ability.
- The lateral groove design can reduce noise generation from tire.
- The sipes on tire center rib can reduce stiffness and enhance driving comfort ability.
- SX-2 designed by 5 pitches computer simulation formula technology can reduce tire noise efficiency.
